AI Sales Activity Assistant

Workflow overview · Prepared for Al Mashani Furniture · Integrated with ERPNext

“Tell the assistant what you did today. It writes it into ERPNext for you.”

The objective

Salespeople spend time typing updates into ERP forms, so records are late, incomplete or missing. This assistant lets the sales team report in plain language, typed or spoken, in a chat they already know. It turns the message into clean ERPNext records and answers questions from live ERPNext data.

1. **Less admin for the team.** One sentence replaces several forms.
2. **Better data for management.** Every activity is structured: client, type, date, details, status.
3. **One source of truth.** ERPNext stays the only database. The assistant keeps no business records of its own.
4. **Safe by design.** Nothing is saved until the user says “yes”, and everyone acts under their own ERPNext account.

Who uses it

Three sales users
Log daily activity, create quotations, ask questions about their own work.

Manager
Sees the combined team view and can confirm sales orders.

Administrator
Decides who may use the bot and who may confirm orders.

One example, start to finish

Met with XYZ Interiors today, sent a quotation for 20 workstations, awaiting their BOQ.

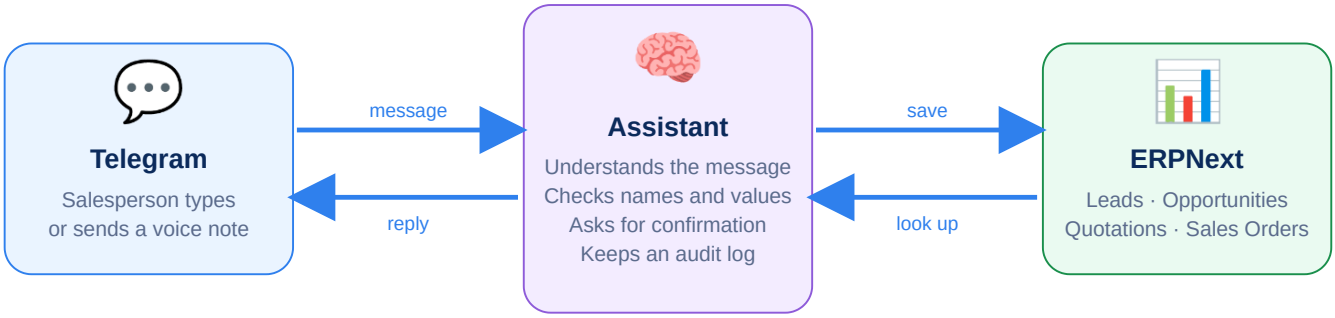

I will record: Client XYZ Interiors · Quotation Sent · today · Awaiting Client. Reply yes or no.

yes

Done. Logged in ERPNext.

The big picture

Three parts, each with one job

An AI language model and speech-to-text service work inside the Assistant.

What happens to a message

1 Send
Text or voice note in Telegram

2 Understand
Voice is transcribed and shown back; the AI picks out client, type, date, status

3 Check
Client matched in ERPNext. Close names get “Did you mean…?”

4 Confirm
A short summary; the user replies yes or no

5 Save
Written to ERPNext under the user’s own account and logged

Two kinds of requests

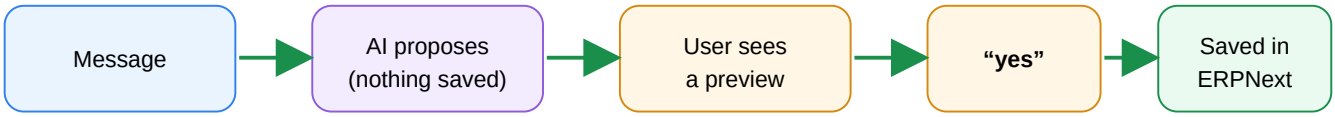

Recording (needs “yes”)	Asking (answered at once)
• Log a meeting, call, quotation sent, BOQ received, order finalized • Create or update an Opportunity • Create a draft Quotation or Sales Order, then submit it • Create a new Lead when the client is new	• “What quotations did we send last month?” • “Show all orders finalized this week” • “How many quotations and what total?” • “Which meetings did I have this week?”

The activity record

Each update becomes one **Sales Activity** in ERPNext with: **client**, **type** (Meeting, Call, Quotation Sent, BOQ Received, Order Finalized), **date**, **details** and **status** (Open, Awaiting Client, In Progress, Completed). A sentence like “sent a quotation” is recorded as an activity. A real Quotation is created only when the user asks for one and gives items and quantities.

Built to be trusted

Why a wrong sentence does not become a wrong record

“no” or 15 minutes pass → cancelled, nothing changed

✔ Confirm first
Every change is previewed. The yes/no is handled by fixed rules, not by the AI.

✔ Own account
Each person acts as their own ERPNext user, so ERPNext permissions apply.

✔ Audit trail
Every request, confirmation, cancellation and error is logged.

✔ No guessing names
“Nazwa Builders” → “Did you mean Nizwa Builders?”

✔ Real prices only
Prices always come from ERPNext, never from the user or the AI.

✔ Approved users only
Only the three approved Telegram accounts can use the bot.

What it deliberately does not do

• Delete records	• Edit already submitted documents (needs cancel and amend)
• Invent clients, items, prices or dates	• Confirm sales orders for everyone (only approved people)

Things to be aware of

Voice accuracy varies	Arabic dialects mixed with English terms can be misheard. The transcript is shown before anything is saved.
The AI is not perfectly consistent	Confirmation, name matching and validation keep wrong entries out of ERPNext.
Data goes to AI providers	Client names and notes are processed by the chosen language and speech providers. This needs the Client’s approval.
Telegram is not end-to-end encrypted	Bot chats are protected in transit only.

What the team gets

Day-to-day benefits and how we get to go-live

⏱ Faster updates
A single sentence or voice note replaces several ERPNext forms.

📋 Cleaner records
Every activity has a client, type, date, details and status.

🔍 Instant answers
Ask about quotations, orders or meetings in plain words.

Examples of what to say

Create a quotation for Nizwa Builders for 4 executive desks and 4 ergonomic chairs.

Draft quotation ready with ERPNext prices. Reply yes to create it.

Show all orders finalized this week.

3 orders finalized, listed with customer and total.

Path to go-live

1 Kickoff
Confirm options and access to ERPNext

›

2 Build
Connect to ERPNext, set up Telegram and the AI

›

3 Demo
Working assistant shown on your ERPNext

›

4 Acceptance
The three users test; fixes made

›

5 Handover
Guide and go-live

Decisions we need from you

- Which ERPNext version do you use, and is it hosted on Frappe Cloud or self-hosted?
- Should each person see only their own data, or should a manager see the combined view?
- Is Telegram acceptable as the production channel, or should WhatsApp or a web app be added?
- Which languages will the team speak and type: English, Arabic or both?
- Is processing of customer names and notes by an external AI provider acceptable under your data policy?
